Email Security Health Check

Be prepared before a breach occurs

How secure is your cloud productivity and collaboration environment?

Email remains the number one attack vector for ransomware, phishing, Business Email Compromise (BEC), credential theft and data loss.

The Siber Group Email Security Health Check helps organisations identify hidden threats, security gaps and opportunities to strengthen protection before an incident occurs.

Email is the #1 attack vector. Don't wait for an incident to discover your gaps.

Works with: Microsoft 365 Google Workspace

What the Health Check Delivers

Identify Hidden Threats

Discover phishing, malware, ransomware, and account compromise attempts reaching users.

- Phishing and impersonation
- Business email compromise (BEC)
- Malicious URLs
- QR codes
- ✓ **Compromised-account & inbox-rule hijacking detection**

Validate Cloud Workspace Protection

Understand where email security controls are performing well and where more protection is needed.

- Detect blind spots
- Missed phishing campaigns
- Inbound threats delivered to users
- Policy weaknesses
- Gaps in remediation and user reporting

Improve Security Operations

Gain actionable recommendations to strengthen detection, prevention, and response.

- No MX changes
- Rapid deployment (4 minutes)
- Minimal user disruption
- Automatic remediation

Reduce Business Risk

Protect users, data, reputation, and operational continuity.

- Reduced account compromise risk
- Improved incident response times
- Reduced ransomware exposure
- Strengthened cyber insurance readiness
- Improved board-level security reporting

Mimecast uses advanced AI to secure collaboration across your organisation's digital landscape. Real-time detection capabilities are updated to track evolving attack techniques.
